Art Unit: 2611

1. This office action, in response to the amendment filed 7/2/2007, is a final office action.

Response to Arguments

- 2. The previous claim objection and rejection of the claims under 35 USC 112, second paragraph is withdrawn.
- 3. New objections to the drawings and the claims are stated below.
- Applicant's arguments filed 7/2/2007 have been fully considered but they are not 4. persuasive. Applicant states the making an estimate of the spreading factor used to transmit the data unit is not disclosed in Dahlman. The examiner disagrees. Dahlman discloses despreading a PCCH using a spreading factor. The despreading of the control channel will recover a spreading factor for the PDCH. This spreading factor is provided to the PDCH demodulator. This spreading factor is the spreading factor estimate. As stated in the previous office action, the variable rate transmissions have the advantage of using a lower bit rate that gives a higher spreading factor and allows a lower transmit power (column 4, lines 1-8). Therefore, the power of the transmit signal corresponds to the spreading factor. The estimate of the spreading factor used to transmit the data will correspond to the estimated spreading factor used to decode the PDCH. In addition, the spreading factor of the PCCH is known in the receiver. However, the spreading factor of the PDCH is not known in the receiver until after the despreading of the PCCH.

For these reasons and the reasons stated in the previous office action, the rejections of the claims are maintained and stated below.

Drawings

5. The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the claims means and components of claims 45-50 must be shown or the features canceled from the claims. A receiver is shown in figure 3. The RF section demodulates the received signal into I and Q portions but does not describe the means or components to decode the specific portions of the control and data information. No new matter should be entered.

Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing should not be labeled as "amended." If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. Each drawing sheet submitted after the filling date of an application must be labeled in the top margin as either "Replacement Sheet" or "New Sheet" pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Objections

6. Claims 45-50 are objected to because of the following informalities: Claims 45-50 claims a system or mobile station and claim components or means to describe the system or mobile station. However, it is unclear where the means or components are disclosed in the originally filed specification. A receiver is shown in figure 3. The RF section demodulates the received signal into I and Q portions but does not describe the means or components to decode the specific portions of the control and data information. Appropriate correction is required.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 7. Claims 16-22, 26-32, 35-37 and 41-50 are rejected under 35 U.S.C. 102(e) as being anticipated by Dahlman et al (US 6,222,875).

Regarding claims 41, 43, 45, 47, 48 and 35-37, Dahlman discloses a method of using the receiver shown in figure 1. The receiver receives a physical data channel (PDCH) and a physical control channel (PCCH). The spreading factor of the PCCH is known a priori to the receiver (column 3, lines 66-67). The PCCH comprised both

control information and data. The decoding of the PCCH channel is at the assumed (a priori) spreading factor. Once the PCCH is demodulated and decoded, the PCCH provides a PDCH spreading factor to the PDCH demodulator (figure 1). The decoding takes place using this spreading factor estimate. This is also described in claims 1 and 5. Dahlman claims a receiver for receiving two physical channels, partially despreading one of the channels, buffering the partially despread signal and despreading the buffered signal using a second code once the bit rate information associated with the first signal is recovered. The variable rate transmissions have the advantage using a lower bit rate that gives a higher spreading factor and allows a lower transmit power (column 4, lines 1-8). Therefore, the power of the transmit signal corresponds to the spreading factor. The estimate of the spreading factor used to transmit the data will correspond to the estimated spreading factor used to decode the PDCH.

Regarding claims 42, 44 and 46, figure 2 discloses the spreading of the PDCH and PCCH with common scrambling.

Regarding claim 16, Dahlman discloses the PDCH and PCCH are combined and share common scrambling. This scrambling interleaves the signals.

Regarding claims 17 and 18, the data to be transmitted comprise a plurality of frames. The "data unit" can be one, many or all of these frames.

Regarding claims 19 and 26-28, the spreading factor used to decode the frame will be the appropriate spreading factor for each specific frame transmitted. This spreading factor can be the lowest spreading factor.

Art Unit: 2611

Regarding claims 20 and 29-32, the relationship between the spreading factor, bit rate and transmit power is known (column 4, lines 1-5).

Regarding claim 21, as stated above, once the spreading factor is recovered from the control information, the data is despread using the spreading factor.

Regarding claim 22, the CDMA system accommodates a plurality of users.

Regarding claims 49 and 50, the variable rate transmissions have the advantage of using a lower bit rate that gives a higher spreading factor and allows a lower transmit power (column 4, lines 1-8). Therefore, the power of the transmit signal corresponds to the spreading factor. The relationship between the spreading factor, bit rate and transmit power is known (column 4, lines 1-5).

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kevin M. Burd whose telephone number is (571) 272-3008. The examiner can normally be reached on Monday - Friday 9 am - 5 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David C. Payne can be reached on (571) 272-3024. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
